

This multi-layer touch screen system is perfect for retail promotion. It can play MPEG video, JPEG still images and MP3 music files from a built-in solid state Compact Flash card. This means no computer hard drive to break over time like a traditional computer kiosk.

This multi-layer programmable touch system gives you more freedom to design an engaging interactive experience for your customers. The amount of content you can feature is only limited by the size of the flash card you use. We can assist you in programming your content or create custom content for you. Programming software is required for configuring the touch selections.
